AI FOUNDATIONS · SUNDAY LEAGUE

SUNDAY LEAGUE FAIR DRAW

A reproducible, code-owned way to turn confirmed attendance into fair teams.

[MY INPUT NEEDED: your name]

THE PROBLEM

MATCHDAY DECISIONS ARE MESSY

My Sunday league needs to turn changing group-chat attendance into teams quickly.

Manual decisions cost time, create arguments, and make fairness difficult to trust.

[MY INPUT NEEDED: exact current process and time cost]

WHAT IS NEW

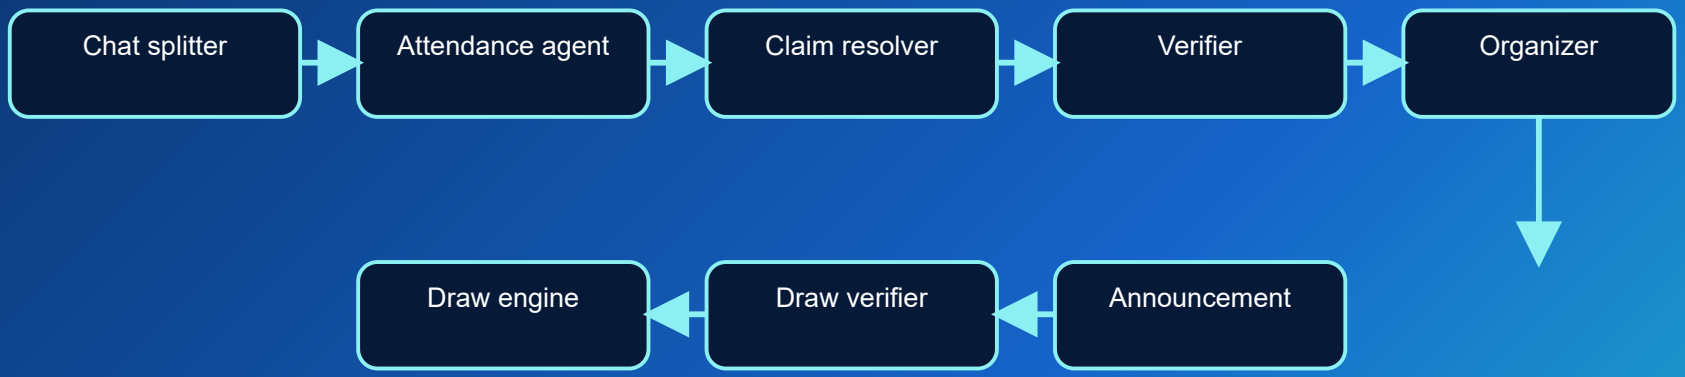

AI ASSISTS. CODE DECIDES.

The model reads attendance language and writes announcements. Code parses senders, resolves claims, confirms the squad, draws teams, and verifies the receipt.

[MY INPUT NEEDED: one verified existing product for comparison]

THE PIPELINE

BOUNDED HANDOFFS

DEMO

FROM PROPOSAL TO PITCH

[MISSING EVIDENCE: attendance proposal screenshot]

[MISSING EVIDENCE: draw on pitch screenshot]

[MISSING EVIDENCE: fairness cards screenshot]

COST TO RUN

MEASURED COST, NOT GUESSED COST

Prices are not set, so only token totals may be reported. The token measurement and cost experiment were refused by configured budgets before producing completed tables.

0	20	8
draw-engine tokens	planned token-measurement calls	per-run call limit

[MISSING EVIDENCE: completed token/cost tables]

SAFETY

STOP UNSAFE OUTPUTS BEFORE THEY SPREAD

Claims are schema-validated; unknown names, mass claims, third-party claims, and invented actions are blocked or held for confirmation.

0	0	0
	injection changes	unknown names accepted

wrong auto-applied third-party/mass claims

[MISSING EVIDENCE: defense log]

[MISSING EVIDENCE: VERIFIED MATCH badge]

IMPACT · SIMULATION

MEMORY REDUCED REPEATED PAIRINGS

Sample roster · 20 nights × 50 repeats · 0.8 attendance probability · minimum 10 attendees · 300 candidates per draw.

Method	Strength gap	Top two same team	Max repeats	Repeat score
A random	1.132 ± .177	56.8%	12.90	1.053
B balance	.089 ± .019	56.2%	11.72	1.063
C balance + memory	.096 ± .021	55.8%	10.58	.972

Source: results/simulation_summary.json.

IMPACT · EVALUATION

SAFETY HELD; RECALL NEEDS WORK

.7500	.1364	.2143
claim precision	claim recall	final attendance accuracy

Five labeled-chat runs were evaluated. The low recall is a real limitation: the model omitted many expected claims.

[MY INPUT NEEDED: real league-night timing, trust results, fairness ratings, and quotes]

NEXT

MAKE THE PROOF AS STRONG AS THE PRODUCT

- Complete a permissioned real-night study.
- Improve attendance extraction against reviewed labels.
- Complete a budget-approved cost comparison.

- Capture verification, trace, token, and share-card evidence.

THANK YOU

FAIR TEAMS. CLEAR PROOF.
